SKILLS

Coding Languages Python, TypeScript, Java, C++, HTML, CSS, JavaScript, Go

Frameworks Angular, React, Bazel, SpringBoot, Django, Flask

Technical AWS, Azure, Kubernetes, Docker

Databases PostGres, MySQL, MongoDB, DynamoDB

CERTIFICATION

2024 AWS Certified Solutions Architect – Associate

2025 AWS Certified Developer – Associate

2025 CompTIA Security+

EXPERIENCE

Booz Allen

June 2024 – Present

Lead Software Engineer

McLean, VA

- Automated the transfer of an install SOP from ServiceNow to a webpage using lambda, S3, and Route53
- Modified a JavaScript function so that attachments in articles housed in ServiceNow can be exported to higher network environments
- Implemented a Docs as Code solution to automate and standardize documentation in classified environments, migrating AWS service and SOP data while leveraging GitLab pipelines for continuous updates across active platforms
- Built a new containerized Hugo-based documentation portal using Docker, enabling users to access, search, and filter relevant SOPs and technical data efficiently in more classified environments.
- Integrated draw.io conversion functionality to automate the transformation of configuration files into PNGs using a Docker container, enhancing visualization capabilities within the documentation system.
- Upgraded and maintained Amazon EKS clusters to the latest stable version, ensuring compatibility, security, and performance improvements in the Kubernetes environment.
- Created a Docker container to resolve Bazel compatibility issues on newer Mac architectures, enabling users to successfully compile binaries locally and eliminating blockers that previously prevented code execution.
- Developed an automated hostname validation system in Go to dynamically generate unique, valid DNS-compliant hostnames based on user input, preventing duplicates and improving system-wide resource identification; implemented comprehensive test cases to validate logic and ensure reliability.

Capital One

Oct 2022 – April 2024

FullStack Engineer

McLean, VA

- Added new functionality that pulled upcoming financial transactions between businesses, saved the data in a redux store, and then displayed the output on the front end UI using Melio and Angular

- Ensured and met security standards of loan transactions by upgrading the SOAP requests to verify tokenization via Xpress and upgraded the SpringBoot application's auditlog package to send log data to enterprise streaming platforms to comply with company technology standards
- Implemented a new shared component that displayed customised messages on the UI for front end users to be aware of updates and changes made to data and transactions
- Upgraded certificates, API calls, and remediated vulnerabilities for Java SpringBoot and Python Lambda applications to improve security and functionality
- Restored the functionality of Jenkins pipelines and implemented a bot to streamline Pull Request automation for inner sourced ACH notification code
- Designed wire fee migration process so that data used by the Finance team would be stored in an enterprise datalake instead of an unmanaged S3 bucket which increased holding capacity by 200%
- Optimized the ACH notification code so that emails would be correctly grouped and sent to small business customers instead individual account holders
- Masked the confidential values for a user's tax id and social security number in Splunk logs to strengthen security and protect customer privacy
- Produced a Splunk dashboard for TreX (production failover process) so that developers can monitor traffic in east and west regions, track status codes, and generate reports for leadership and analytics
- Created PagerDuty alerts to better react to application errors, monitor production resources and notify developers to solve issues reducing reaction time from a couple minutes to couple seconds

CACI

Software Engineer II

Jan 2021 – Sept 2022

Sterling, VA

- Appointed to be part of a tiger team for a technology stack refresh whose goal is to move from a monolithic code base to a Microservices architecture
- Designed a custom leaflet plugin that implemented a geospatial feature that added graphic mapping and customization
- Migrated the team's code development IDE from IntelliJ to VS Code after participating in a tiger team for choosing an alternative IDE to IntelliJ
- Led a team of engineers to develop a logistics tracking system that will streamline the process to request, purchase, and track requisition orders

Textron Systems

Software Engineer II

Feb 2017 – Nov 2020

Sterling, VA

- Upgraded the SeeMed project to the newest version to Angular and added the ability to download from an S3 bucket containing brain imagery
- Automated the generation of API Swagger documentation and incorporated it into the build pipeline
- Implemented an API using Flask, Kafka, and GrayLog to process metadata and log messages
- Created a serverless geospatial image conversion application using AWS's Lambda, Route53, Elastic Container Services, SQS, and S3 buckets, and developed a caching system using Node.js
- Prototyped a thin client version of Textron's flagship product RemoteView using AWS's Workspaces, Active Directory, and DynamoDB
- Refactored the User Interface of the Textron's newest geospatial web application written in TypeScript and Angular, as well as created the authentication layer in Node.js
- Revamped the chat component of a deployed software using XMPP, strophe.js, and Openfire

EDUCATION

Penn State University | *Bachelor of Science in Computer Science*

2012-2016
